

**HILLSBOROUGH TOWNSHIP SCHOOL DISTRICT**

**MATHEMATICS CURRICULUM**

**Grade 7**

**July, 2020**

## Course Overview

### Grade 7

The grade seven mathematics program emphasizes the following content strands as they align with the grade seven New Jersey Student Learning Standards (NJSLS) in mathematics: Ratios and Proportional Relationships, The Number System, Expressions and Equations, Geometry, and Statistics and Probability. The New Jersey Student Learning Standards for Mathematical Practice: make sense of problems and persevere in solving them; reason abstractly and quantitatively; construct viable arguments and critique the reasoning of others; model with mathematics, use appropriate tools strategically; attend to precision; look for and make use of structure; and look for and express regularity in repeated reasoning are embedded in the daily teaching and learning. The content is presented using a problem solving approach designed to develop critical thinking skills while embedding the mathematical processes into the daily teaching and learning. Practice of basic skills is ongoing through a variety of routines and activities. Topics are revisited regularly and practice is distributed over time to facilitate full concept development. Activities explore a wide variety of content with opportunities for students to apply basic fact skills to geometry, measurement and algebra. Program implementation and assessment offers enrichment and reinforcement based on individual student needs. The grade seven mathematics program prepares students to take the New Jersey Student Learning Assessment 7 or any new generation assessment developed. Successful completion of the seventh grade mathematics program prepares students for entry into either the eighth grade mathematics program or algebra 1.

**Grade 7 Mathematics Curriculum**

<b>Unit Title:</b> Unit 1 Number Sense and Rational Numbers	<b>Time Frame/Pacing:</b> 40 Days
<b>Essential Questions</b> <ul style="list-style-type: none"><li>• What happens when we operate on rational numbers?</li></ul>	
<b>Enduring Understandings</b> <ul style="list-style-type: none"><li>• There are patterns to rational numbers and therefore when we operate on them there are predictable outcomes.</li></ul>	
<b>Standards Taught and Assessed</b> <ul style="list-style-type: none"><li>■ Major Cluster<ul style="list-style-type: none"><li>• 7.NS.A.1 Apply and extend previous understandings of addition and subtraction to add and subtract rational numbers; represent addition and subtraction on a horizontal or vertical number line diagram.<ul style="list-style-type: none"><li>○ a. Describe situations in which opposite quantities combine to make 0. For example, in the first round of a game, Maria scored 20 points. In the second round of the same game, she lost 20 points. What is her score at the end of the second round?</li><li>○ b. Understand <math>p + q</math> as the number located a distance <math> q </math> from <math>p</math>, in the positive or negative direction depending on whether <math>q</math> is positive or negative. Show that a number and its opposite have a sum of 0 (are additive inverses). Interpret sums of rational numbers by describing real-world contexts.</li><li>○ c. Understand subtraction of rational numbers as adding the additive inverse, <math>p - q = p + (-q)</math>. Show that the distance between two rational numbers on the number line is the absolute value of their difference and apply this principle in real-world contexts.</li><li>○ d. Apply properties of operations as strategies to add and subtract rational numbers.</li></ul></li><li>• 7.NS.A.2 Apply and extend previous understandings of multiplication and division of fractions to multiply and divide rational numbers.<ul style="list-style-type: none"><li>○ a. Understand that multiplication is extended from fractions to rational numbers by requiring that operations continue to satisfy the properties of operations, particularly the distributive property, leading to products such as <math>(-1)(-1) = 1</math> and the rules for multiplying signed numbers. Interpret products of rational numbers by describing real-world contexts.</li><li>○ b. Understand that integers can be divided, provided that the divisor is not zero, and every quotient of integers (with non-zero divisor) is a rational number. If <math>p</math> and <math>q</math> are integers, then <math>-(p/q) = (-p)/q = p/(-q)</math>. Interpret quotients of rational numbers by describing real world contexts.</li><li>○ c. Apply properties of operations as strategies to multiply and divide rational numbers.</li><li>○ d. Convert a rational number to a decimal using long division; know that the decimal form of a rational number terminates in 0s or eventually repeats.</li></ul></li><li>• 7.NS.A.3 Solve real-world and mathematical problems involving the four operations with rational numbers.</li></ul></li></ul>

<b>Unit Title:</b> Unit 2 Equations & Expressions	<b>Time Frame/Pacing:</b> 37 Days
<b>Essential Questions</b> <ul style="list-style-type: none"><li>• How can we use mathematical models as tools to best describe and help explain real-life situations?</li></ul>	
<b>Enduring Understandings</b> <ul style="list-style-type: none"><li>• Real-life situations can be represented with mathematical models.</li></ul>	
<b>Standards Taught and Assessed</b>  ■ Major Cluster <ul style="list-style-type: none"><li>• 7.EE.A.1 Apply properties of operations as strategies to add, subtract, factor, and expand linear expressions with rational coefficients.</li><li>• 7.EE.A.2 Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related. <i>For example, <math>a + 0.05a = 1.05a</math> means that "increase by 5%" is the same as "multiply by 1.05."</i></li><li>• 7.EE.B.3 Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. <i>For example: If a woman making \$25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or \$2.50, for a new salary of \$27.50. If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation.</i></li><li>• 7.EE.B.4 Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities.<ul style="list-style-type: none"><li>○ a. Solve word problems leading to equations of the form <math>px + q = r</math> and <math>p(x + q) = r</math>, where <math>p</math>, <math>q</math>, and <math>r</math> are specific rational numbers. Solve equations of these forms fluently. Compare an algebraic solution to an arithmetic solution, identifying the sequence of the operations used in each approach. <i>For example, the perimeter of a rectangle is 54 cm. Its length is 6 cm. What is its width?</i></li><li>○ b. Solve word problems leading to inequalities of the form <math>px + q &gt; r</math> or <math>px + q &lt; r</math>, where <math>p</math>, <math>q</math>, and <math>r</math> are specific rational numbers. Graph the solution set of the inequality and interpret it in the context of the problem. <i>For example: As a salesperson, you are paid \$50 per week plus \$3 per sale. This week you want your pay to be at least \$100. Write an inequality for the number of sales you need to make, and describe the solutions.</i></li></ul></li></ul>

<b>Essential Questions</b> <ul style="list-style-type: none"><li>• How can change be best represented mathematically?</li></ul>	
<b>Enduring Understandings</b> <ul style="list-style-type: none"><li>• Patterns and relationships can be represented graphically, numerically, symbolically, or verbally.</li></ul>	
<b>Standards Taught and Assessed</b>  ■ Major Cluster <ul style="list-style-type: none"><li>• 7.RP.A.1 Compute unit rates associated with ratios of fractions, including ratios of lengths, areas and other quantities measured in like or different units. <i>For example, if a person walks 1/2 mile in each 1/4 hour, compute the unit rate as the complex fraction 1/2/1/4 miles per hour, equivalently 2 miles per hour.</i></li><li>• 7.RP.A.2 Recognize and represent proportional relationships between quantities.<ul style="list-style-type: none"><li>○ a. Decide whether two quantities are in a proportional relationship, e.g., by testing for equivalent ratios in a table or graphing on a coordinate plane and observing whether the graph is a straight line through the origin.</li><li>○ b. Identify the constant of proportionality (unit rate) in tables, graphs, equations, diagrams, and verbal descriptions of proportional relationships.</li><li>○ c. Represent proportional relationships by equations. <i>For example, if total cost <math>t</math> is proportional to the number <math>n</math> of items purchased at a constant price <math>p</math>, the relationship between the total cost and the number of items can be expressed as <math>t = pn</math>.</i></li><li>○ d Explain what a point <math>(x, y)</math> on the graph of a proportional relationship means in terms of the situation, with special attention to the points <math>(0, 0)</math> and <math>(1, r)</math> where <math>r</math> is the unit rate.</li></ul></li><li>• 7.RP.A.3 Use proportional relationships to solve multistep ratio and percent problems. Examples: simple interest, tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error.</li><li>• 7.EE.B.3 Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. <i>For example: If a woman making \$25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or \$2.50, for a new salary of \$27.50. If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation.</i></li></ul>	

Key: ■ Major Cluster    □ Supporting Cluster    ⊙ Additional Cluster

**Hillsborough Township Public Schools  
Grade 7 Mathematics Curriculum**

⊙ Additional Cluster

- 7.G.A.1 Solve problems involving scale drawings of geometric figures, including computing actual lengths and areas from a scale drawing and reproducing a scale drawing at a different scale.

**Highlighted Interdisciplinary Connections**

- 6.2.8.B.2.b Compare and contrast physical maps of ancient river valley civilizations and their modern counterparts, and determine the geopolitical impact of these civilizations, then and now.
- MS-ESS1-1: Develop and use a model of the Earth-Sun-Moon system to describe the cyclic patterns of lunar phases, eclipses of the sun

**Highlighted Career Ready Practices and 21st Century Themes and Skill**

- 9.1.8.CDM.2: Demonstrate an understanding of the terminology associated with different types of credit (e.g., credit cards, installment loans, mortgages, lines of credit) and compare and calculate the interest rates associated with each
- • 9.4.8.CI.1: Assess data gathered on varying perspectives on causes of climate change (e.g., cross cultural, gender-specific, generational), and determine how the data can best be used to design multiple potential solutions

**Social Emotional Learning Competencies**

- 2.1.8.EH.2: Analyze how personal attributes, resiliency, and protective factors support mental and emotional health.
- 2.1.8.SSH.2: Develop a plan for the school to promote dignity and respect for people of all genders, gender identities, gender expressions, and sexual orientations in the school community.
- 2.1.8.PGD.4: Analyze the relationship between healthy behaviors and personal health.

**Pre-Assessment**

- 7.RP.A.1
- 7.RP.A.2.a
- 7.RP.A.2.b
- 7.RP.A.2.c
- 7.RP.A.3

**Modifications/Accommodations (ELL, Special Education, Gifted, At-Risk of Failure, 504)**

- extended time, scribe, speech to text, challenge questions, and specific other accommodations/modifications per a student's IEP or 504 plan

**Grade 7 Mathematics Curriculum**

<b>Unit Title:</b> Unit 5 Statistics & Probability	<b>Time Frame/Pacing:</b> 30 days
<b>Essential Questions</b> <ul style="list-style-type: none"><li>• How can experimental and theoretical probabilities be used to make predictions and draw conclusions?</li></ul>	
<b>Enduring Understandings</b> <ul style="list-style-type: none"><li>• The results of a statistical investigation can be used to support or refute an argument.</li></ul>	
<b>Standards Taught and Assessed</b>  <input type="checkbox"/> Supporting Cluster <ul style="list-style-type: none"><li>• 7.SP.A.1 Understand that statistics can be used to gain information about a population by examining a sample of the population; generalizations about a population from a sample are valid only if the sample is representative of that population. Understand that random sampling tends to produce representative samples and support valid inferences.</li><li>• 7.SP.A.2 Use data from a random sample to draw inferences about a population with an unknown characteristic of interest. Generate multiple samples (or simulated samples) of the same size to gauge the variation in estimates or predictions. For example, estimate the mean word length in a book by randomly sampling words from the book; predict the winner of a school election based on randomly sampled survey data. Gauge how far off the estimate or prediction might be.</li><li>• 7.SP.C.5 Understand that the probability of a chance event is a number between 0 and 1 that expresses the likelihood of the event occurring. Larger numbers indicate greater likelihood. A probability near 0 indicates an unlikely event, a probability around 1/2 indicates an event that is neither unlikely nor likely, and a probability near 1 indicates a likely event.</li><li>• 7.SP.C.6 Approximate the probability of a chance event by collecting data on the chance process that produces it and observing its long-run relative frequency, and predict the approximate relative frequency given the probability. For example, when rolling a number cube 600 times, predict that a 3 or 6 would be rolled roughly 200 times, but probably not exactly 200 times.</li><li>• 7.SP.C.7 Develop a probability model and use it to find probabilities of events. Compare probabilities from a model to observed frequencies; if the agreement is not good, explain possible sources of the discrepancy.</li><li>• SP.C.7.A Develop a uniform probability model by assigning equal probability to all outcomes, and use the model to determine probabilities of events. For example, if a student is selected at random from a class, find the probability that Jane will be selected and the probability that a girl will be selected.</li><li>• 7.SP.C.7.B Develop a probability model (which may not be uniform) by observing frequencies in data generated from a chance process. For example, find the approximate probability that a spinning penny will land heads up or that a tossed paper cup will land open-end down. Do the outcomes for the spinning penny appear to be equally likely based on the observed frequencies?</li></ul>

**Grade 7 Mathematics Curriculum**

- 7.SP.C.8 Find probabilities of compound events using organized lists, tables, tree diagrams, and simulation.
- 7.SP.C.8.A Understand that, just as with simple events, the probability of a compound event is the fraction of outcomes in the sample space for which the compound event occurs.
- 7.SP.C.8.B Represent sample spaces for compound events using methods such as organized lists, tables and tree diagrams. For an event described in everyday language (e.g., "rolling double sixes"), identify the outcomes in the sample space which compose the event.
- 7.SP.C.8.C Design and use a simulation to generate frequencies for compound events. For example, use random digits as a simulation tool to approximate the answer to the question: If 40% of donors have type A blood, what is the probability that it will take at least 4 donors to find one with type A blood?

⊙ Additional Cluster

- 7.SP.B.3 Informally assess the degree of visual overlap of two numerical data distributions with similar variabilities, measuring the difference between the centers by expressing it as a multiple of a measure of variability. For example, the mean height of players on the basketball team is 10 cm greater than the mean height of players on the soccer team, about twice the variability (mean absolute deviation) on either team; on a dot plot, the separation between the two distributions of heights is noticeable.
- 7.SP.B.4 Use measures of center and measures of variability for numerical data from random samples to draw informal comparative inferences about two populations. For example, decide whether the words in a chapter of a seventh-grade science book are generally longer than the words in a chapter of a fourth-grade science book.

**Highlighted Interdisciplinary Connections**

- MS-LS1-5 Construct a scientific explanation based on evidence for how environmental and genetic factors influence the growth of organisms
- 8.1.8.DA.1: Organize and transform data collected using computational tools to make it usable for a specific purpose.
- 8.1.8.CS.1: Recommend improvements to computing devices in order to improve the ways users interact with the devices.

**Highlighted Career Ready Practices and 21st Century Themes and Skill**

- 9.4.8.CI.1: Assess data gathered on varying perspectives on causes of climate change (e.g., cross cultural, gender-specific, generational), and determine how the data can best be used to design multiple potential solutions
- 9.4.8.DC.8: Explain how communities use data and technology to develop measures to respond to effects of climate change
- 9.4.8.GCA.2: Demonstrate openness to diverse ideas and perspectives through active discussions to achieve a group goal
